

Using Levels

Levels are a very useful tool in Revit. Your Artcraft template will come with these levels already drawn. Create a level to lock your ceiling height – just copy and paste your level. Set your ceiling height here. Then click your wall, and set their height to that level.

We include levels for your toe kick, base heights, countertop width, bottom of your uppers and your hanging height. Using levels will make it easier to keep your drawing consistent and helps to make revisions to your drawing much faster.

If you find the levels are making your drawing hard to read, you can right click and select “Hide in View” and “Elements”. They will still be there, they are just hidden. To see any hidden elements, you can always click on the lightbulb icon at the bottom of the screen. To bring them back, right click and select “Unhide in View” and “Elements”.

Revision #2
